Description

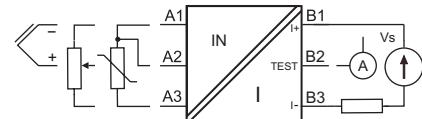

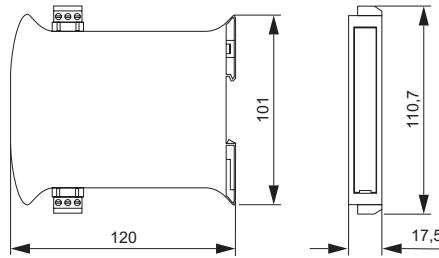

The LXT-811-D transducer converts temperature from an input sensor to the output current signal 4...20mA. A device works as a current loop regulator with galvanic separation between an input sensor and the output. The LXT-811-D is self powered from the current loop.

A device assures cold junction compensation (if thermocouple is connected as input signal) or it makes input wire resistance compensation (if resistive element is connected).

Front jumpers allow for easy and comfortable setting all parameters: sensor type, operating range, compensation and sensor break signalization.

There is possibility to deliver device for non-standard signals on demand.

Dimm. / Connect.
