## Description

The BGSX22G5A10 RF MOS switch is specifically designed for LTE and WCDMA triple antenna applications. This DPDT offers low insertion loss and low harmonic generation paired with high isolation between RF ports.

The switch is controlled via a GPIO interface. The on-chip controller allows power-supply voltages from 1.65V to 3.4V.

The switch features direct-connect-to-battery functionality and DC-free RF ports. Unlike GaAs technology, external DC blocking capacitors at the RF Ports are only required if DC voltage is applied externally. The BGSX22G5A10 RF Switch is manufactured in Infineon's patented MOS technology, offering the performance of GaAs with the economy and integration of conventional CMOS including the inherent higher ESD robustness. The device has a very small size of only 1.1 x 1.5mm<sup>2</sup> and a maximum thickness of 0.55mm.

Maximum Ratings

**2 Maximum Ratings**

**Table 1: Maximum Ratings Table** at  $T_A = 25\text{ }^\circ\text{C}$ , unless otherwise specified

Parameter	Symbol	Values			Unit	Note / Test Condition

GPIO control voltage levels	$V_{Ctrlx}$	-0.7	–	$V_{DD}+0.7$ (max. 3.6V)	V	–

<sup>1)</sup>Switch has a lowpass response. For higher frequencies, losses have to be considered for their impact on thermal heating. The DC voltage at RF ports  $V_{RFDC}$  has to be 0V.

<sup>2)</sup>Note: Consider potential ripple voltages on top of  $V_{DD}$ . Including RF ripple,  $V_{DD}$  must not exceed the maximum ratings:  $V_{DD} = V_{DC} + V_{Ripple}$ . Furthermore, high pulse voltages at  $V_{DD}$  pin will cause the ESD structure to trigger.

<sup>3)</sup>Field-Induced Charged-Device Model ANSI/ESDA/JEDEC JS-002. Simulates charging/discharging events that occur in production equipment and processes. Potential for CDM ESD events occurs whenever there is metal-to-metal contact in manufacturing.

<sup>4)</sup>Human Body Model ANSI/ESDA/JEDEC JS-001 (R=1,5 k $\Omega$ , C=100 pF).

<sup>5)</sup>IEC 61000-4-2 (R=330  $\Omega$ , C=150 pF), contact discharge.

**Warning: Stresses above the max. values listed here may cause permanent damage to the device. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit. Exposure to conditions at or below absolute maximum rating but above the specified maximum operation conditions may affect device reliability and life time. Functionality of the device might not be given under these conditions.**
