

NCL30160

1.0A Constant-Current Buck Regulator for Driving High Power LEDs

The NCL30160 is an NFET hysteretic step-down, constant-current driver for high power LEDs. Ideal for automotive, industrial and general lighting applications utilizing minimal external components. The NCL30160 operates with an input voltage range from 6.3 V to 40 V. The hysteretic control gives good power supply rejection and fast response during load transients and PWM dimming to LED arrays of varying number and type. A dedicated PWM input ($\overline{\text{DIM/EN}}$) enables wide range of pulsed dimming and a high switching frequency up to 1.4 MHz allows the use of smaller external components minimizing space and cost. Protection features include resistor-programmed constant LED current, shorted LED protection, under-voltage and thermal shutdown. The NCL30160 is available in a SOIC-8 package.

Features

- Integrated 1.0A MOSFET
- VIN Range 6.3 V to 40 V
- Short LED Shutdown Protection
- Up to 1.4 MHz Switching Frequency
- No Control Loop Compensation Required
- Adjustable LED Current
- Single Pin Brightness and Enable/Disable Control Using PWM
- Supports All-Ceramic Output Capacitors and Capacitor-less Outputs
- Thermal Shutdown Protection
- Capable of 100% Duty Cycle Operation
- This is a Pb-Free Device

Typical Application

- LED Driver
- Constant Current Source
- Automotive Lighting
- General Illumination
- Industrial Lighting

NCL30160

Figure 1. Typical Application Circuit

PIN FUNCTION DESCRIPTION

| Pin | Pin Name | Description | Application Information |
|------|----------|---|---|
| 1, 2 | CS | Current Sense feedback pin | Set the current through the LED array by connecting a resistor from this pin to ground. |
| 3 | GND | Ground Pin | Ground. Reference point for all voltages |
| 4 | VCC | Output of Internal 5 V linear regulator | The VCC pin supplies the power to the internal circuitry. The VCC is the output of a linear regulator which is powered from VIN. A 2 μ F ceramic capacitor is recommended for bypassing and should be placed as close as possible to the VCC and AGND pins. Do not connect to an external load. |
| 5 | ROT | Off-Time Setting Resistor | Resistor ROT from this pin to VCC sets the Off-Time range for the hysteretic controller. |
| 6 | DIM/EN | PWM Dimming Control & ENABLE | Connect a logic-level PWM signal to this pin to enable/disable the power MOSFET and LED array |
| 7 | VIN | Input Voltage Pin | Nominal operating input range is 6.3 V to 40 V. Input supply pin to the internal circuitry and the positive input to the current sense comparators. Due high frequency noise, a 10 μ F ceramic capacitor is recommended to be placed as close as possible to VIN and power ground. |
| 8 | LX | Drain of Internal Power MOSFET | The LX pin connects to the inductor and provides the switching current necessary to operate in hysteretic mode. |

NCL30160

MAXIMUM RATINGS

| Rating | Symbol | Min | Max | Unit |
|---|-----------------------|---|-----|------|
| VIN to GND | VIN | -0.3 | 40 | V |
| MOSFET Drain Voltage to GND | LX | - | 40 | V |
| VCC to GND | VCC | - | 6 | V |
| $\overline{\text{DIM}}/\text{EN}$ to GND | DIM | -0.3 | 6 | V |
| CS to GND | CS | -0.3 | 6 | V |
| ROT to GND | ROT | -0.3 | 6 | V |
| Absolute Maximum Junction Temperature | $T_{J(\text{MAX})}$ | 150 | | °C |
| Operating Junction Temperature Range | T_J | -40 | 125 | °C |
| Maximum LED Drive Current | ILIM | 1.5 | | A |
| Storage Temperature Range | T_{stg} | -55 to +125 | | °C |
| Thermal Characteristics | | | | |
| | | SOIC-8 Plastic Package | | |
| | PD | Maximum Power Dissipation @ $T_A = 25^\circ\text{C}$ (Note 1) | | W |
| | $R_{\theta\text{JA}}$ | Thermal Resistance Junction-to-Air (Note 2) | | °C/W |
| | | 1.11 | | |
| | | 111.7 | | |
| Lead Temperature Soldering (10 sec): Re-flow (SMD styles only) | T_L | 260 peak | | °C |
| | | Pb-Free (Note 3) | | |
| Moisture Sensitivity Level (Note 4) | MSL | 1 | | - |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The maximum package power dissipation limit must not be exceeded.

$$P_D = \frac{T_{J(\text{max})} - T_A}{R_{\theta\text{JA}}}$$

2. When mounted on a multi-layer board with 35 mm² copper area, using 1 oz Cu.
3. 60–180 seconds minimum above 237°C.
4. Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020A.

NCL30160

ELECTRICAL CHARACTERISTICS (Unless otherwise noted: $V_{IN} = 12\text{ V}$, $T_A = 25^\circ\text{C}$, unless otherwise specified.)

| Symbol | Characteristics | Min | Typ | Max | Unit |

| $t_{OFF-MIN}$ | Minimum Off-time | | | 137 | | ns |
|---------------|------------------|--|--|-----|--|----|

- The functional range of V_{IN} is the voltage range over which the device will function. Output current and internal parameters may deviate from normal values for V_{IN} and V_{CC} voltages between 6.3 V and 8 V, depending on load conditions
- V_{CC} should not be driven from a voltage higher than V_{IN} or in the absence of a voltage at V_{IN} .
- Guaranteed by design.

THEORY OF OPERATION

This switching power supply is comprised of an inverted buck regulator controlled by a current mode, hysteretic control circuit. The buck regulator operates exactly like a conventional buck regulator except the power device placement has been inverted to allow for a low side power FET. Referring to Figure 1, when the FET is conducting, current flows from the input, through the inductor, the LED and the FET to ground.

When the FET shuts off, current continues to flow through the inductor and LED, but is diverted through the diode (D1). This operation keeps the current in the LED continuous with a continuous current ramp.

The control circuit controls the current hysteretically. Figure 2 illustrates the operation of this circuit. The CS comparator thresholds are set to provide a 10% current ripple. The peak current comparator threshold of 220 mV sets I_{peak} at 10% above the average current while the valley current comparator threshold of 180 mV sets I_{valley} at 10% below the average current.

When the FET is conducting, the current in the inductor ramps up. This current is sensed by an external sense resistor that is connected from CS to ground. When the CS pin reaches 220 mV, the peak current comparator turns off the power FET. A conventional hysteretic controller would monitor the load current and turn the switch back on when the CS pin reaches 180 mV. But in this topology, the current information is not available to the control circuit when the FET is off. To set the proper FET off time, the CS voltage is

sensed when the FET is turned back on and a correction signal is sent to the off time circuit to adjust the off time as necessary.

Figure 5. Typical Current Waveforms

The current waveshape is triangular, and the peak and valley currents are controlled. The average value for a triangular waveshape is halfway between the peak and valley, so even with changes in duty cycle due to input voltage variations or load changes, the average current will remain constant.

In the event there is a short-circuit across the LEDs, a large amount of current could potentially flow through the circuit during startup. To protect against this, the NCL30160 comes with a short circuit protection feature. If the voltage on the CS pin is detected to be greater than 500 mV (equating to 2.5 times the intended average output current), the NCL30160 will turn off the FET, and prevent the FET from turning on again until power is recycled to NCL30160.

Figure 6. Short-Circuit Protection

When V_{IN} rises above the UVLO threshold voltage, switching operation of the FET will begin. However, until the V_{IN} voltage reaches 8 V, the VCC regulator may not provide the expected gate drive voltage to the FET. This could result in the $R_{DS(on)}$ of the FET being higher than expected or there not being enough gate drive capability to operate at the maximum rated switching frequency. For optimal performance, it is recommended to operate the part at a V_{IN} voltage of 8 V or greater.

Setting The Output Current

The average output current is determined as being the middle of the peak and valley of the output current, set by the CS comparator thresholds. The nominal average output current will be the current value equivalent to 200 mV at the CS pin. The proper R_{SENSE} value for a desired average output current can be calculated by:

$$R_{SENSE} = \frac{200 \text{ mV}}{I_{LED}}$$

PWM Dimming

For a given R_{SENSE} value, the average output current, and therefore the brightness of the LED, can be set to a lower value through the DIM/EN pin. When the DIM/EN pin is brought low, the internal FET will turn off and switching will remain off until the DIM/EN pin is brought back into its high state.

Figure 7. Dimming Waveforms

By applying a pulsed signal to DIM/EN, the average output current can be adjusted to the duty ratio of the pulsed signal. It is recommended to keep the frequency of the DIM/EN signal above 100 Hz to avoid any visible flickering of the LED.

Figure 8. Dimming Performance

Inductor Selection

The inductor that is used directly affects the switching frequency the driver operates at. The value of the inductor sets the slope at which the output current rises and falls during the switching operation. The slope of the current, in turn, determines how long it takes the current to go from the valley point of the current ripple to the peak when the FET is on and the current is rising, and how long it takes the current to go from the peak point of the current to the valley when the FET is off and the current is falling. These times can be approximated from the following equations:

$$t_{ON} = \frac{L \times \Delta I}{V_{IN} - V_{LED} - I_{OUT} \times (R_{DS(on)} + DCR_L + R_{SENSE})}$$

$$t_{OFF} = \frac{L \times \Delta I}{V_{LED} + V_{diode} + I_{OUT} \times DCR_L}$$

Where DCR_L is the dc resistance of the inductor, V_{LED} is the forward voltages of the LEDs, $FET_{RDS(ON)}$ is the on-resistance of the power MOSFET, and V_{diode} is the forward voltage of the catch diode.

The switching frequency can then be approximated from the following:

$$f_{SW} = \frac{1}{t_{ON} + t_{OFF}}$$

Higher values of inductance lead to slower rates of rise and fall of the output current. This allows for smaller discrepancies between the expected and actual output current ripple due to propagation delays between sensing at the CS pin and the turning on and off of the power MOSFET. However, the inductor value should be chosen such that the peak output current value does not exceed the rated saturation current of the inductor.

Catch Diode Selection

The catch diode needs to be selected such that average current through the diode does not exceed the rated average forward current of the diode. The average current through the diode can be calculated as:

$$I_{avg_diode} = I_{OUT} \times \frac{t_{OFF}}{t_{ON} + t_{OFF}}$$

It is also important to select a diode that is capable of withstanding the peak reverse voltage it will see in the application. It is recommended to select a diode with a rated reverse voltage greater than V_{IN} . It is also recommended to use a low-capacitance Schottky diode for better efficiency performance.

Selecting The Off-Time Setting Resistor

The off-time setting resistor (R_{OT}) programs the NCL30160 with the initial time duration that the MOSFET is turned off when the switching operation begins. During subsequent switching cycles, the voltage at the CS pin is sensed every time the MOSFET is turned on, and the off-time will be adjusted depending on how much of a discrepancy exists between the sensed value and the CS lower limit threshold value. The R_{OT} value can be calculated using the following equation:

$$R_{OT} = t_{OFF} \times 10^{11} \Omega$$

Where t_{OFF} is the expected off time during normal switching operation, calculated in the Inductor Selection section above.

Input Capacitor

A decoupling capacitor from V_{IN} to ground should be used to provide the current needed when the power MOSFET turns on. A 4.7 μF ceramic capacitor is recommended.
