

## Automotive fully integrated H-bridge motor driver

Datasheet - production data

### Features

| Type       | $R_{DS(on)}$                   | $I_{out}$ | $V_{CCmax}$ |
|------------|--------------------------------|-----------|-------------|
| VNH7070BAS | 70 m $\Omega$ typ<br>(per leg) | 15 A      | 38 V        |

- AEC-Q100 qualified
- Output current: 15 A
- 3 V CMOS-compatible inputs
- Undervoltage shutdown
- Overvoltage clamp
- Thermal shutdown
- Cross-conduction protection
- Current and power limitation
- Very low standby power consumption
- Protection against loss of ground and loss of  $V_{CC}$
- PWM operation up to 20 kHz
- CS diagnostic functions
  - Analog motor current feedback
  - Output short to ground detection
  - Thermal shutdown indication
  - OFF-state open-load detection
  - Output short to  $V_{CC}$  detection
- Output protected against short to ground and short to  $V_{CC}$
- Standby Mode
- Half Bridge Operation
- Package: ECOPACK<sup>®</sup>

### Description

The device is a full bridge motor driver intended for a wide range of automotive applications. The device incorporates a dual monolithic high-side driver and two low-side switches.

Both switches are designed using STMicroelectronics' well known and proven proprietary VIPower<sup>®</sup> M0-7 technology that allows to efficiently integrate on the same die a true Power MOSFET with an intelligent signal/protection circuitry. The three dies are assembled in SO-16N package on electrically isolated lead-frames.

Moreover, its fully symmetrical mechanical design allows superior manufacturability at board level. The input signals  $IN_A$  and  $IN_B$  can directly interface the microcontroller to select the motor direction and the brake condition. A SEL0 pin is available to address the information available on the CS to the microcontroller. The CS pin allows to monitor the motor current by delivering a current proportional to the motor current value. The PWM, up to 20 kHz, allows to control the speed of the motor in all possible conditions. In all cases, a low level state on the PWM pin turns off both the  $LS_A$  and  $LS_B$  switches.

**Table 1. Device summary**

| Package | Order codes |               |
|---------|-------------|---------------|
|         | Tube        | Tape and reel |
| SO-16N  | —           | VNH7070BASTR  |

# 1 Block diagram and pin description

Figure 1. Block diagram

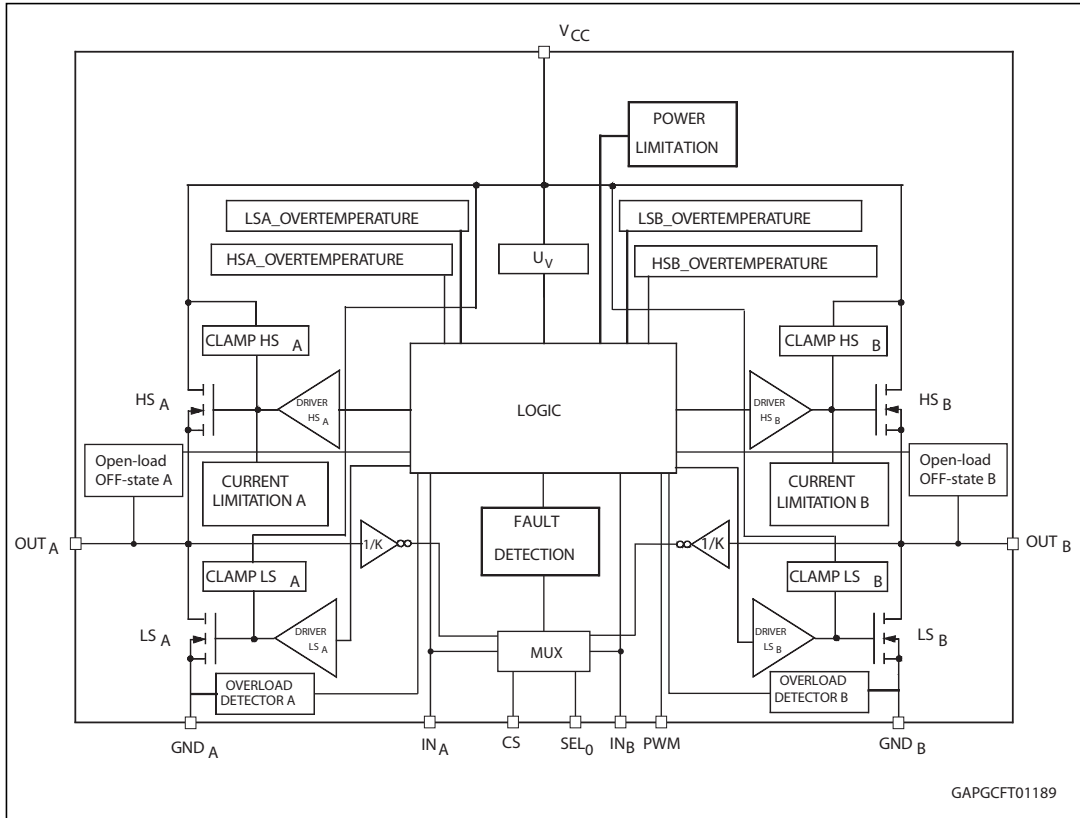

Table 2. Block description

| Name  | Description   |
|---|---|
| Logic control                                     | Allows the turn-on and the turn-off of the high-side and the low-side switches according to the truth table.  |
| Undervoltage                                      | Shuts down the device for battery voltage lower than 4 V.   |
| High-side and low-side clamp voltage              | Protect the high-side and the low-side switches from the high voltage on the battery line.  |
| High-side and low-side driver                     | Drive the gate of the concerned switch to allow a proper $R_{on}$ for the leg of the bridge.  |
| Current limitation                                | Limits the motor current in case of short circuit.  |
| High-side and low-side overtemperature protection | In case of short-circuit with the increase of the junction temperature, it shuts down the concerned driver to prevent degradation and to protect the die. |
| Low-side overload detector                        | Detects when low side current exceeds shutdown current and latches off the concerned Low side.  |

**Table 2. Block description (continued)**

| Name             | Description  |
|------------------|--|
| Fault detection  | Signals the abnormal behavior of the switch through CS pin.  |
| Power limitation | Limits the power dissipation of the high-side driver inside safe range in case of short to ground condition. |

**Figure 2. Configuration diagram (top view)**

**Table 3. Pin definitions and functions**

| Pin N°   | Symbol           | Function   |
|----------|------------------|--|
| 1, 16    | GND <sub>A</sub> | Source of low-side switch A  |
| 2, 15    | OUT <sub>A</sub> | Source of high-side switch A / drain of low-side switch A  |
| 3        | IN <sub>A</sub>  | Clockwise input  |
| 4, 5, 12 | V <sub>CC</sub>  | Power supply voltage   |
| 6        | IN <sub>B</sub>  | Counter clockwise input  |
| 7, 10    | OUT <sub>B</sub> | Source of high-side switch B / drain of low-side switch B  |
| 8, 9     | GND <sub>B</sub> | Source of low-side switch B  |
| 11       | PWM              | Voltage controlled input pin with hysteresis, CMOS compatible. Gates of low-side FETS get modulated by the PWM signal during their on phase allowing speed control of the motor  |
| 13       | CS               | Multiplexed analog sense output pin; it delivers a current proportional to the motor current according to the leg selection.   |
| 14       | SEL <sub>0</sub> | Active high compatible with 3 V and 5 V CMOS outputs pin; in combination with IN <sub>A</sub> , IN <sub>B</sub> , it addresses the CurrentSense information delivered to the micro according to the operative truth table. |

## 2 Electrical specifications

Figure 3. Current and voltage conventions

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 4: Absolute maximum ratings](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Table 4. Absolute maximum ratings

| Symbol      | Parameter   | Value              | Unit |
|-------------|---|--------------------|------|
| $V_{CC}$    | Supply voltage  | 38                 | V    |
| $-V_{CC}$   | Reverse DC Supply Voltage   | 0.3                | V    |
| $I_{max}$   | Maximum output current (continuous)   | Internally limited | A    |
| $I_R$       | Reverse output current (continuous)   | -15                | A    |
| $V_{CCPK}$  | Maximum transient supply voltage (ISO 16750-2:2010 Test B clamped to 40 V; $R_L = 4 \Omega$ ) | 40                 | V    |
| $V_{CCJS}$  | Maximum jump start voltage for single pulse short circuit protection                          | 28                 | V    |
| $I_{IN}$    | Input current ( $IN_A$ and $IN_B$ pins)   | -1 to 10           | mA   |
| $I_{SELO}$  | $SEL_0$ DC input current  | -1 to 10           | mA   |
| $I_{PWM}$   | PWM input current   | -1 to 10           | mA   |
| $I_{SENSE}$ | CS pin DC output current ( $V_{GND} = V_{CC}$ and $V_{SENSE} < 0 V$ )                         | 10                 | mA   |
|             | CS pin DC output current in reverse ( $V_{CC} < 0 V$ )  | -20                |      |

**Table 4. Absolute maximum ratings (continued)**

| Symbol           | Parameter  | Value      | Unit |
|------------------|--|------------|------|

| $R_{ONHS}$           | Static high-side resistance                           | $I_{OUT} = 3.5\text{ A}$ ; $T_j = 25\text{ }^\circ\text{C}$  |      | 42   |      | m $\Omega$    |
|                      |   | $I_{OUT} = 3.5\text{ A}$ ; $T_j = -40\text{ to }150\text{ }^\circ\text{C}$   |      |      | 85   | m $\Omega$    |
| $R_{ONLS}$           | Static low-side resistance                            | $I_{OUT} = 3.5\text{ A}$ ; $T_j = 25\text{ }^\circ\text{C}$  |      | 30   |      | m $\Omega$    |
|                      |   | $I_{OUT} = 3.5\text{ A}$ ; $T_j = -40\text{ }^\circ\text{C to }150\text{ }^\circ\text{C}$  |      |      | 60   | m $\Omega$    |
| $V_f$                | Free-wheeling diode forward voltage                   | $I_{OUT} = -3.5\text{ A}$ ; $T_j = 150\text{ }^\circ\text{C}$  |      | 0.7  | 0.9  | V             |
| $I_{L(off)}$         | Off-state output current of one leg                   | $I_{N_A} = I_{N_B} = 0$ ; PWM = 0; $V_{CC} = 13\text{ V}$ ; $T_j = 25\text{ }^\circ\text{C}$                                     | 0    |      | 0.5  | $\mu\text{A}$ |
|                      |   | $I_{N_A} = I_{N_B} = 0$ ; PWM = 0; $V_{CC} = 13\text{ V}$ ; $T_j = 125\text{ }^\circ\text{C}$                                    | 0    |      | 3    | $\mu\text{A}$ |
| $I_{L(off\_h)}$      | Off-state output current of one leg with other HSD on | $I_{N_A} = 0$ ; $I_{N_B} = 5\text{ V}$ ; PWM = 0; $V_{CC} = 13\text{ V}$   | 20   |      | 60   | $\mu\text{A}$ |

1. To power on the device from the standby, it is recommended to:  
 — toggle  $I_{N_A}$  or  $I_{N_B}$  or  $SEL_0$  from 0 to 1 first to come out from STBY mode  
 — toggle PWM from 0 to 1 with a delay of 20  $\mu\text{s}$   
 this avoids any over-stress on the device in case of existing short-to-battery.

**Table 7. Logic inputs (IN<sub>A</sub>, IN<sub>B</sub>) (V<sub>CC</sub> = 7 V up to 28 V; -40 °C < T<sub>j</sub> < 150 °C)**

| Symbol  | Parameter                | Test conditions          | Min. | Typ. | Max. | Unit |
|---|--------------------------|--------------------------|------|------|------|------|
| V <sub>IL</sub>   | Input low level voltage  |                          |      |      | 0.9  | V    |
| V <sub>IH</sub>   | Input high level voltage |                          | 2.1  |      |      | V    |

|                 |                 | 0                |     |                         |      |      |      |      |
| 0               | 0               | 1                | 0   | x <sup>(1)</sup>        | Off  | Off  | Off  | Off  |
|                 |                 | 0 <sup>(2)</sup> |     |                         |      |      |      |      |

1. Refer to [Table 13: Off-state -truth table](#)
2. For IN<sub>A</sub> = IN<sub>B</sub> = SEL<sub>0</sub> = PWM = 0, the device enters in standby after T<sub>D\_sdb</sub>y

**Table 12. On-state fault conditions- truth table**

| Digital Input pins |     |     |      | CS      | Comment                                   |
|--------------------|-----|-----|------|---------|---|
| INA                | INB | PWM | SELO |         |   |
| 0                  | 0   | 1   | 0    | VsenseH | LSB protection triggered; LSB latched off |
| 0                  | 0   | 1   | 1    | VsenseH | LSA protection triggered; LSA latched off |
| 0                  | 1   | X   | 0    | VsenseH | HSB protection triggered; HSB latched off |
| 0                  | 1   | 1   | 1    | VsenseH | LSA protection triggered; LSA latched off |
| 1                  | 0   | 1   | 0    | VsenseH | LSB protection triggered; LSB latched off |
| 1                  | 0   | X   | 1    | VsenseH | HSA protection triggered; HSA latched off |
| 1                  | 1   | X   | 0    | VsenseH | HSB protection triggered; HSB latched off |
| 1                  | 1   | X   | 1    | VsenseH | HSA protection triggered; HSA latched off |

*Note:* Other logic combinations on digital input pins not reported on the above table don't allow to detect a latched off channel.

1. The device enters standby mode after T<sub>D\_sdby</sub>
2. To power on the device from the standby, it is recommended to toggle INA or INB from 0 to 1 first and then PWM from 0 to 1 to avoid any over-stress on the device in case of short-to-battery.

## 2.4 Waveforms

Figure 12. Normal operative conditions

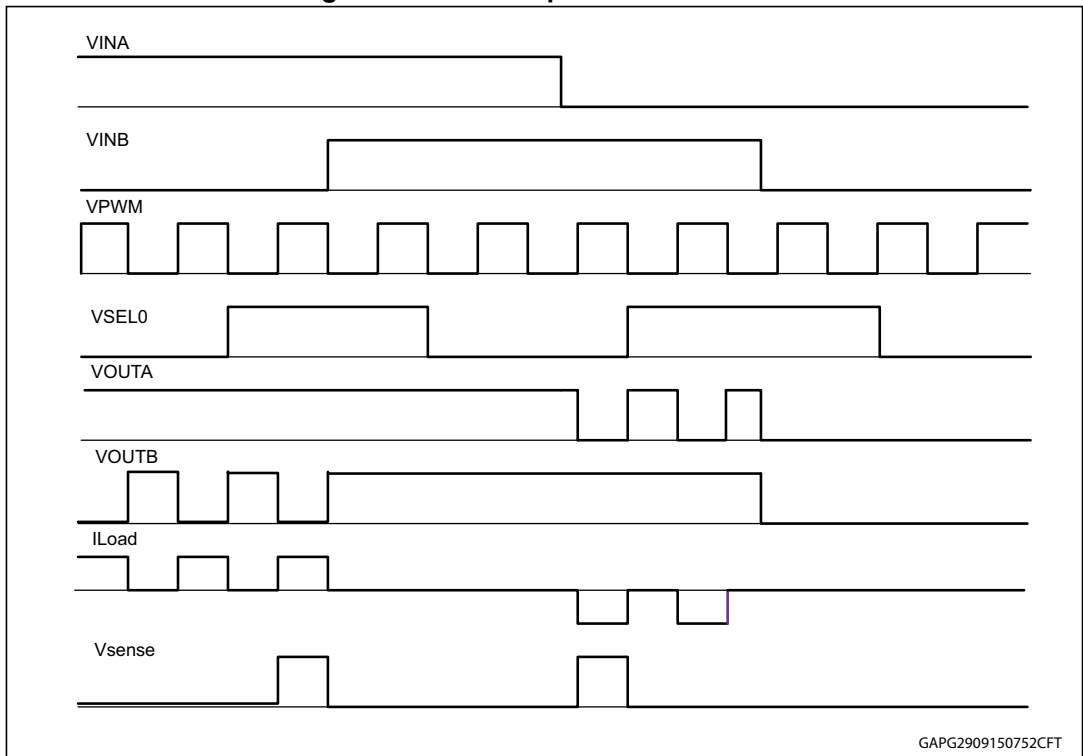

Figure 13. OUT shorted to ground and short clearing

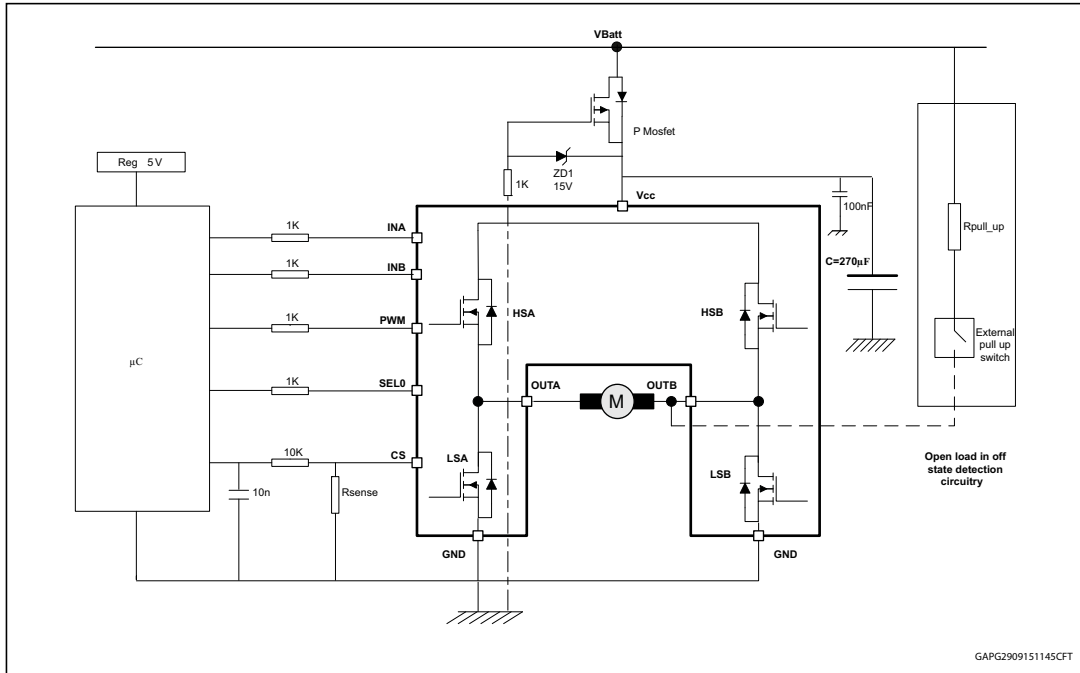

Figure 14. OUT shorted to Vcc and short clearing

### 3 Application information

Here following there is the typical application schematic suggested for a proper operation of the device in DC or PWM conditions.

Figure 15. Application schematic with reverse battery protection connected to Vbatt

GAPG2909151145CFT

Figure 16. Application schematic with reverse battery protection connected to GND

GAPG2909151148CFT

Figure 17. Suggested PCB layout

Note: *PCB layout recommendation:  
 Optimized connection (short) between Drain LSD and Source HSD  
 Optimized GNDa and GNDb connection (symmetric connection)*

### 3.1 Reverse battery protection

Three possible solutions can be considered:

- A Schottky diode D connected to V<sub>CC</sub> pin
- An N-channel MOSFET connected to the GND pin
- A P-channel MOSFET connected to the V<sub>CC</sub> pin

In case the reverse battery protection is not present, the device sustains no more than -15 A because of the two Body diodes of the Power MOSFETs. Additionally, in reverse battery condition the I/Os of the device is pulled down to the V<sub>CC</sub> line (approximately -1.5 V).

Series resistor must be inserted to limit the current sunk from the microcontroller I/Os. If I<sub>Rmax</sub> is the maximum target reverse current through microcontroller I/Os, series resistor is:

$$R = \frac{V_{IOs} - V_{CC}}{I_{Rmax}}$$

### 3.2 OFF-state open-load detection – External circuitry dimensioning

The detection of an open-load in off state requires an external circuitry to be connected between Output and V<sub>BATT</sub>.

For the detection it is necessary to put one network on each leg in case of Half Bridge operation or one network on one of the output in case of full bridge (see [Table 13: Off-state -truth table](#)).

The external circuitry is made up by an external pull-up resistor R<sub>pull\_up</sub> connecting the output to a positive supply voltage V<sub>PU</sub> (V<sub>Batt</sub>).

It is preferable to switch-off  $V_{PU}$  by using an external pull\_up switch to reduce the overall standby current during the module standby mode.

$R_{pull\_up}$  must be dimensioned to ensure that in normal operative conditions  $V_{OUT} > V_{OLmax}$ .

To satisfy this condition the  $R_{pull\_up}$  must be selected according to:

- if the device is used in half bridge configuration, the equation is:

$$R_{pull\_up} < \frac{V_{BATTmin} - V_{OLmax}}{I_{L(off2)min[@VOLmax]}}$$

- if the device is used in H-bridge configuration, the equation is:

$$R_{pull\_up} < \frac{V_{BATTmin} - V_{OLmax}}{2 \times I_{L(off2)min[@VOLmax]}}$$

### 3.3 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the  $V_{CC}$  pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 14](#).

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through  $V_{CC}$  and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

**Table 14. ISO 7637-2 - electrical transient conduction along supply line**

| Test Pulse 2011(E)                             | Test pulse severity level with Status II functional performance status |             | Minimum number of pulses or test time | Burst cycle / pulse repetition time |        | Pulse duration and pulse generator internal impedance |
|--|--|-------------|---------------------------------------|-------------------------------------|--------|---|
|  | Level  | $U_S^{(1)}$ |                                       | min                                 | max    |   |
| 1  | III  | -112 V      | 500 pulses                            | 0,5 s                               |        | 2ms, 10 $\Omega$                                      |
| 2a   | III  | +55 V       | 500 pulses                            | 0,2 s                               | 5 s    | 50 $\mu$ s, 2 $\Omega$                                |
| 3a   | IV   | -220 V      | 1h                                    | 90 ms                               | 100 ms | 0.1 $\mu$ s, 50 $\Omega$                              |
| 3b   | IV   | +150 V      | 1h                                    | 90 ms                               | 100 ms | 0.1 $\mu$ s, 50 $\Omega$                              |
| 4 <sup>(2)</sup>                               | IV   | -7 V        | 1 pulse                               |                                     |        | 100ms, 0.0 1 $\Omega$                                 |
| <b>Load dump according to ISO 16750-2:2010</b> |  |             |                                       |                                     |        |   |
| Test B <sup>(3)</sup>                          |  | 40 V        | 5 pulse                               | 1 min                               |        | 400 ms, 2 $\Omega$                                    |

1.  $U_S$  is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

2. Test pulse from ISO 7637-2:2004(E).
3. With 40 V external suppressor referred to ground ( $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$ ).

### 3.4 Device configurations

Figure 18. Half-bridge configuration (case a)

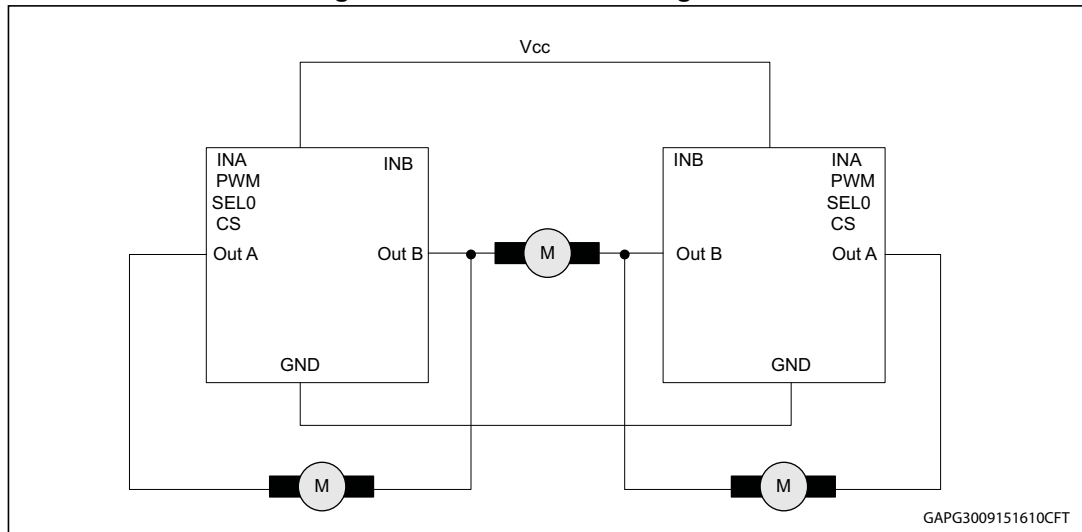

Note: The VNH7070BAS can be used in half bridge configuration as the two legs can be independently driven. The SEL0 pin can be used to address the diagnostic on the CS according to the operative truth table.

Figure 19. Half-bridge configuration (case b)

Note: The VNH7070BAS can be used in applications where an half-bridge with a resistance of 50 mΩ per leg is needed.

Figure 20. Multi-motors configuration

*Note:* The VNH7070BAS can easily be designed in multi motor driving configuration in the applications where only one motor at a time must be activated. The SELO pin can be used to read the diagnostic on the CS according to the operative truth table.

## 4 Package and PCB thermal data

### 4.1 SO16-N thermal data

Figure 21. PCB layout (top and bottom): footprint, 2+2+2 cm<sup>2</sup>, 8+8+8 cm<sup>2</sup>

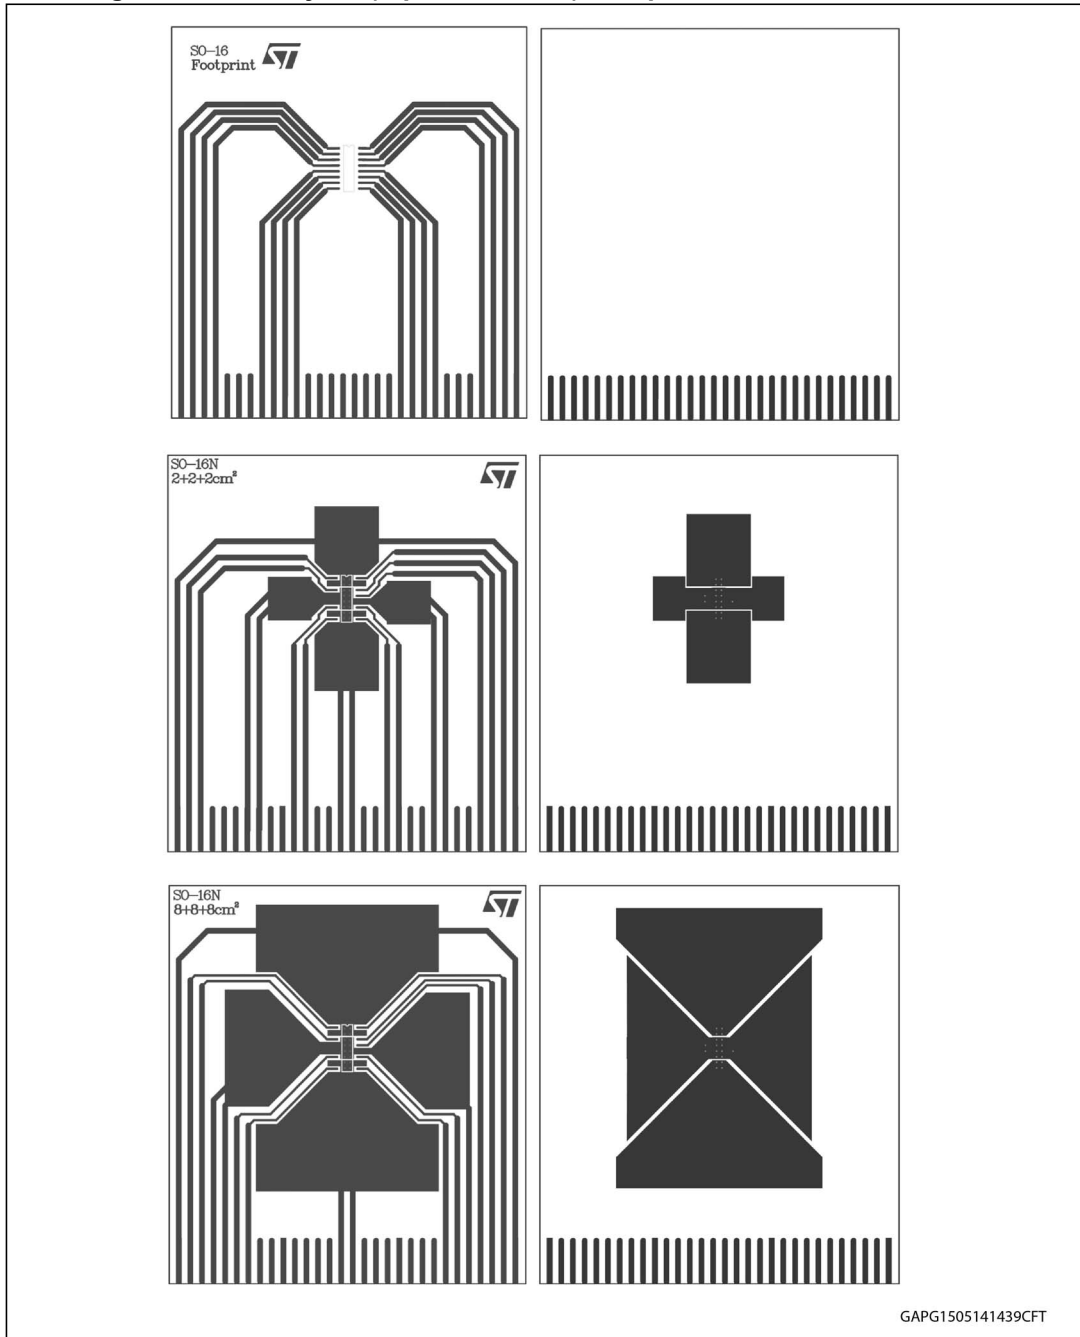

Figure 22. PCB 4 layer

Note: Board finish thickness 1.6 mm +/- 10%; Board double layer and four layers; Board dimension 77x86 mm; Board Material FR4; Cu thickness 0.070mm (outer layers); Cu thickness 0.035mm (inner layers); Thermal via separation 1.2 mm; Thermal via diameter 0.3 mm +/- 0.08 mm; Cu thickness on vias 0.025 mm.

## 4.2 Package thermal data

### 4.2.1 Thermal characterization in steady state conditions

Figure 23. Chipset configuration in steady state conditions

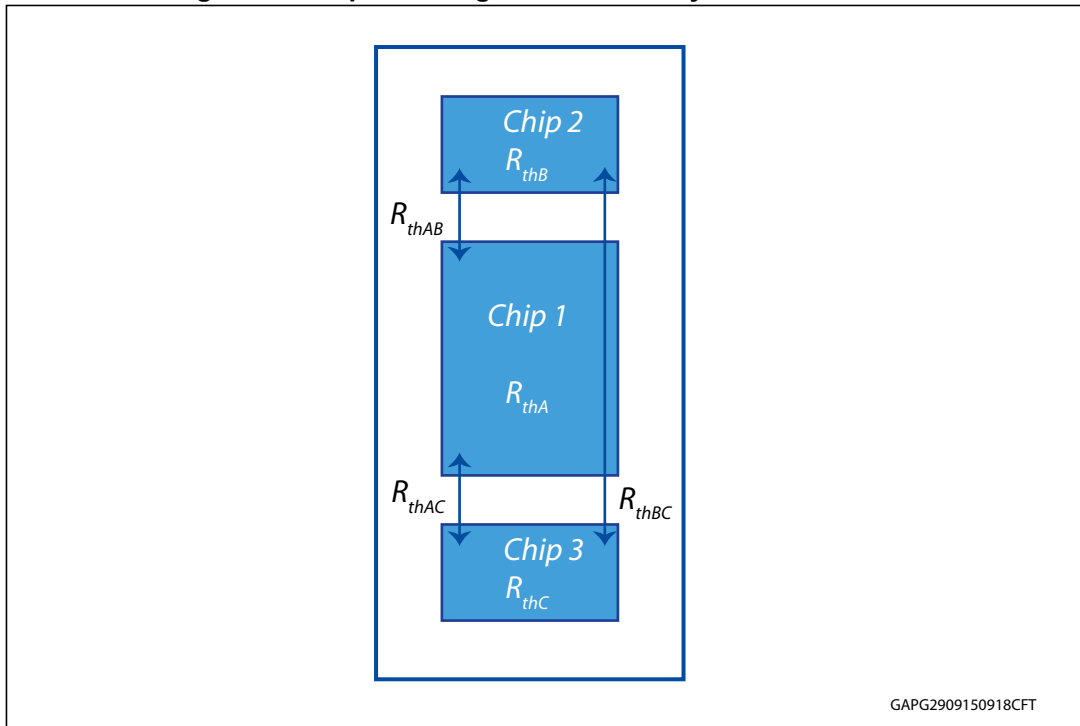

Figure 24. Auto and mutual  $R_{thj-amb}$  vs. PCB heat-sink area in open box free air condition

Table 15. Thermal model for junction temperature calculation in steady-state conditions

| Chip 1 | Chip 2 | Chip 3 | Tjchip1   | Tjchip2  | Tjchip3  |
|--------|--------|--------|---|--|--|
| ON     | OFF    | ON     | $P_{dchip1} \cdot R_{thA} + P_{dchip3} \cdot R_{thAC} + T_{amb}$                | $P_{dchip1} \cdot R_{thAB} + P_{dchip3} \cdot R_{thBC} + T_{amb}$                            | $P_{dchip1} \cdot R_{thAC} + P_{dchip3} \cdot R_{thC} + T_{amb}$                             |
| ON     | ON     | OFF    | $P_{dchip1} \cdot R_{thA} + P_{dchip2} \cdot R_{thAB} + T_{amb}$                | $P_{dchip1} \cdot R_{thAB} + P_{dchip2} \cdot R_{thB} + T_{amb}$                             | $P_{dchip1} \cdot R_{thAC} + P_{dchip2} \cdot R_{thBC} + T_{amb}$                            |
| ON     | OFF    | OFF    | $P_{dchip1} \cdot R_{thA} + T_{amb}$  | $P_{dchip1} \cdot R_{thAB} + T_{amb}$  | $P_{dchip1} \cdot R_{thAC} + T_{amb}$  |
| ON     | ON     | ON     | $P_{dchip1} \cdot R_{thA} + (P_{dchip2} + P_{dchip3}) \cdot R_{thAB} + T_{amb}$ | $P_{dchip2} \cdot R_{thB} + P_{dchip1} \cdot R_{thAB} + P_{dchip3} \cdot R_{thBC} + T_{amb}$ | $P_{dchip1} \cdot R_{thAB} + P_{dchip2} \cdot R_{thBC} + P_{dchip3} \cdot R_{thC} + T_{amb}$ |

### 4.2.2 Thermal characterization during transients

$$T_{hs} = P_{dhs} \cdot Z_{hs} + Z_{hsls} \cdot (P_{dlsA} + P_{dlsB}) + T_{amb}$$

$$T_{lsA} = P_{dlsA} \cdot Z_{ls} + P_{dhs} \cdot Z_{hsls} + P_{dlsB} \cdot Z_{lsls} + T_{amb}$$

$$T_{lsB} = P_{dlsB} \cdot Z_{ls} + P_{dhs} \cdot Z_{hsls} + P_{dlsA} \cdot Z_{lsls} + T_{amb}$$

| D (min)        | 20.2                 |
| N              | 100                  |
| W1 (+2 /-0)    | 16.4                 |
| W2 (max)       | 22.4                 |

1. All dimensions are in mm.

Figure 30. SO-16N rcarrier tape

Table 19. SO-16N carrier tape dimensions

| Description | Value           |
|-------------|-----------------|
| $A_0$       | $6.55 \pm 0.1$  |
| $B_0$       | $10.38 \pm 0.1$ |
| $K_0$       | $2.10 \pm 0.1$  |
| $K_1$       | $1.80 \pm 0.1$  |
| F           | $7.50 \pm 0.1$  |

Table 19. SO-16N carrier tape dimensions (continued)

| Description    | Value       |
|----------------|-------------|
| P <sub>1</sub> | 8.00 ± 0.1  |
| W              | 16.00 ± 0.3 |

### 5.3 SO-16N marking information

Figure 32. SO-16N marking information

GAPG0807151558CFT

Parts marked as 'ES' are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 6 Revision history

**Table 20. Document revision history**

| Date        | Revision | Changes  |
|-------------|----------|--|
| 23-Aug-2016 | 1        | Initial release.   |
| 24-Mar-2017 | 2        | Document status promoted from target specification to production data.<br>Updated: <ul style="list-style-type: none"> <li>– <math>V_{CCmax}</math> value in cover page;</li> <li>– Added as first feature “AEC-Q100 qualified” in cover page;</li> <li>– Note 1 of the <a href="#">Table 6: Power section on page 9</a>;</li> <li>– <a href="#">Table 10: CS (7 V &lt; <math>V_{CC}</math> &lt; 18 V) on page 12</a>, <math>I_{SENSEH}</math> parameter;</li> <li>– <a href="#">Table 12: On-state fault conditions- truth table on page 18</a>;</li> <li>– <a href="#">Figure 25</a>, <a href="#">Figure 26</a> and <a href="#">Figure 27</a>;</li> <li>– <a href="#">Table 16: Thermal parameters on page 31</a>.</li> </ul> |
